Reasons for Allowance

1. The following is an examiner's statement of reasons for allowance: None of the references cited or the art searched disclose or teach alone or in combination the simulation of interconnect lines where the interconnect lines are partitioned into groups which do not interact with each other as recited in claims 1 and 41, the method of modeling an integrated circuit where the modeling occurs without a linegroup affecting the modeling of other line groups as recited in claims 12 and 46, the computer-readable medium where the interconnect lines are partitioned into groups which do not interact with each other as recited in claim 28, and the method of simulating interconnect lines where the lines are partitioned into groups where each group has a select interaction with another group as recited in claim 37 and 47.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Relevant Prior Art

2. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Auger (4703482) discloses an apparatus for detecting faults in microprocessors, which uses an interface device to simulate the interconnections between the main system and a variety of microprocessors.

Glover (5081602) discloses a computer simulation system for electrical connectors using a first set of stored connector defining parameters for geometry and a second set of stored parameters for signals.

LeBlanc (5949991) discloses a method of analyzing signal propagation delays through interconnect wires, where a plurality of interconnect lines is generated, and the associated data is mapped into a distributed circuit model including appropriate impedance elements.

Stellenberg (6167364) discloses a method and apparatus for generating interconnect patterns in a programmable logic device using a model of interconnect lines represented by a ladder network or resistors with arbitrary load models.

Sercu (6353801) discloses a method of simulating a planar structure with top and bottom conductors, where dividing it into a number of rectangular or triangular cells simulates the structure.

Teig (6915500) discloses a method for implementing wiring layers on an integrated circuit, which includes a step of dividing interconnect lines into independent groups, where diagonal lines are considered independent from horizontal lines since they reside on a different metal layer.
